## INTRODUCTION

The Direction Controlled Anti-Tank Missile (DCAT) is a shoulder fired weapon with a rear located jet reaction control system. The control system utilizes four bi-stable fluidic valves powered by a portion of the exhaust gases during the post eject, boost phase of the missile's flight. Two candidate fins are proposed to afford tube launch capability, a flat folding fin ( $F_4$ ) and a curved wrap around fin ( $F_5$ ). The model was tested with the control system operated at two conditions; at design level (supply pressure to ambient pressure ratio = 86) and an over pressure level (pressure ratio = 130).

Tests were conducted at the NASA-Ames facility in the 14 Foot Transonic and the 8 x 7 Foot Supersonic Tunnels. Test Mach number range was from  $M = 0.64$  to 2.5 and the model was tested over the angle-of-attack range  $\pm 4$  degrees.

## MODEL DESCRIPTION

### External Geometry:

A 1:5 percent scale model of the DCAT was used during the tests. Photographs of the model are shown in figures 4 and 5. Details of the external geometry are given in figure 2. Cut outs shown in the fins are intended to accommodate the mechanism used to extend the fins after launch. Both fins (fold down fin, F<sub>4</sub> & wrap around fin, F<sub>5</sub>) were tested with simulated "pop up" springs installed in these cut outs. The trailing edge of each fin extended one-half inch beyond the model base when installed. The launch tube bore riders shown attached to F<sub>4</sub> are in practice installed on the missile surface, but for ease of fabrication were mounted on this fin. Fin F<sub>5</sub> was not tested with the bore rider installed. The fin retaining band is utilized to provide structural support to the forward fin mounting pads and was tested installed with F<sub>4</sub> only. The four conduits located 90° apart and oriented between the fins simulated wiring tunnels on the missile used to route electrical leads from the gyro guidance package forward of the motor to the fluidic control package near the missile base. These conduits were installed on all configurations tested.

### Fluidic Valves:

The four single stage jet reaction control valves were located in the model with the exhaust ports located as shown in figure 2. These valves are flight hardware valves modified to fit the oversize model and to accept commands from a remote device rather than a gyro package. Each

valve is a bi-stable fluidic device which may be switched by closing the appropriate control port. Switching of these valves is controlled at 60 cycles per sec. Control is produced by biasing the flow in the desired direction during a portion of each cycle. Cold air was supplied to the valves during testing to simulate the hot gasses employed during flight.

It was necessary to adjust the operating concept of the control system in the wind tunnel to afford matching flight conditions. In flight, the hot gas is supplied to the valves at 1250 psi (86 times ambient air pressure). In the reduced atmosphere, both the supply pressure level and pressure ratio could not be maintained. The parameter selected to be matched was pressure ratio. Maintaining this ratio allowed duplicating the external flow characteristics developed due to the interaction between the control jet flow and the free stream. However, the flight thrust of the valves was not duplicated at the reduced pressure level. A determination of the "scaled" thrust was made by calibrating the model with the tunnel evacuated to test pressures but with no free stream flow. This information is presented in figure 3.

#### CONFIGURATIONS INVESTIGATED

A summary of the configurations and conditions investigated is given in table I. Configuration B<sub>2</sub>F<sub>4</sub>C is the configuration of primary interest and testing of B<sub>2</sub>F<sub>5</sub>C and off-design control pressurization ( $P_{O_j}/P_F = 130$ ) was accomplished only to the extent of test time available. Extensive

testing was done to determine if operating the control system in a plane interfered with control system operation in the opposite plane. Testing of the control system-on condition was not done at Mach numbers 2.20 and 2.50 since no effect of the control system was found as this range was approached.

#### TEST FACILITY DESCRIPTION

The 9-by-7 Foot Supersonic Tunnel is a component of the Ames Unitary Plan Wind Tunnel. This test facility is a closed-loop, continuous flow, variable-density tunnel. The Mach number range of the 9-by-7 leg of this tunnel is from 1.4 to 2.6. The test was conducted under the Mach numbers from 1.55 to 2.50 at stagnation pressures of 16 to 22 psia.

The 14 Foot Transonic Tunnel is a closed-loop, continuous flow with a constant stagnation pressure (14.7 psi). Mach number range of this facility is from 0.6 to 1.2. Testing was conducted from 0.64 to 1.10 Mach number.

## DATA REDUCTION

Forces and moments were reduced to non-dimensional coefficient form in the missile axis system. Reference dimensions used in the reduction are:

$$S_{\text{ref}} = .11 \text{ sq. ft.}$$

$$\ell_{\text{ref}} = .375 \text{ ft.}$$

$$B_{\text{ref}} = .375 \text{ ft.}$$

$$X_{\text{MRP}} = 0.0$$

$$Y_{\text{MRP}} = 0.0$$

$$Z_{\text{MRP}} = 0.0$$

The data accuracy is considered to be reflected by the repeatability of the data in the pitch plane ( $C_N$  &  $C_m$ ). The measurement in the yaw plane ( $C_y$ ) was strongly influenced by the dynamic response of the sting-balance-model. Therefore, this data usefulness is limited to determining levels and trends.

NOMENCLATURE  
General

<u>SYMBOL</u>	<u>SADSAC SYMBOL</u>	<u>DEFINITION</u>
$a$		speed of sound; m/sec, ft/sec
$C_p$	CP	pressure coefficient; $(p_1 - p_\infty)/q$
$M$	MACH	Mach number; $V/a$
$P$		pressure; N/m <sup>2</sup> , psf
$q$	$q(NCM)$ $q(PSF)$	dynamic pressure; $1/2 \rho V^2$ , N/m <sup>2</sup> , psf
$Re/L$	Re/L	unit Reynolds number; per m, per ft
$V$		velocity; m/sec, ft/sec
$\alpha$	ALPHA	angle of attack, degrees
$\beta$	BETA	angle of sideslip, degrees

$C_l$	CBL	rolling-moment coefficient; $\frac{\text{rolling moment}}{qSb}$

# ADDITIONS TO NOMENCLATURE

<u>SYMBOL</u>	<u>SADSAC SYMBOL</u>	<u>DEFINITION</u>
$P_F$		free stream static pressure, psia.
$P_{O_j}$		control system supply pressure, psia.
$P_{O_j}/P_F$	POJ/PF	ratio of control system pressure to free stream pressure.
$P_{MOD}$	P-MOD	control system modulation in pitch plane.
$Y_{MOD}$	Y-MOD	control system modulation in yaw plane.
$B_2$	B2	body
C		conduits spaced 90° apart
MOD		modulation, a positive modulation is a force that causes a positive moment; a modulated force is a portion of the total reactive force acting in a selected direction, for a 60% modulation flow is biased in the desired direction for 80% of a cycle and for 20% of the cycle the flow is directed in the opposite direction yielding a net force in the desired direction for 60% of the cycle.
	CPB	base pressure coefficient.
